

INSTALLATION INSTRUCTIONS

102056 Digital Dash Upgrade Processor Chip

This microprocessor chip is designed as a direct replacement for the 1984-1987 Regal dash cluster equipped with the digital dash option. The original processor was programmed to indicate a maximum of 85 MPH vehicle speed, then would flash the "85" regardless of what speed the vehicle goes over and above that.

This upgrade removes the "blinking 85" limitation and permits the speedometer to indicate actual speed, up to a maximum of 199 MPH. The metric KPH indications will also show a maximum of 199 KPH and all other functions of the dash will be normal.

It is imperative that you use the proper installation procedures to remove the original microprocessor and to replace it with the specially programmed processor. Failure to do so voids the warranty of this item. Be SURE the processor chip is installed as shown here:
