

NEW PRODUCT RELEASE

12159 Hi-Lo Fan Controller – C6 Corvette, Z06, ZR1

Part Number 102159 For Model Years 2005 – 2009

Finally, a manual fan controller for the C6! New design Plug And Play module installs easily to the PWM-controlled coolant fan found on the C6 Corvette. The factory coolant fan is powerful and incorporates a solid-state controller instead of relays (as in previous years and models). This module interfaces with the factory controller and permits manual coolant fan control.

This module simply plugs into the fan connector and includes a round rocker switch that matches similar design control switches found in the console. Using this switch allows the vehicle operator to manually override the ECU control of the coolant fan, to force-cool the engine, even when the car is unattended and not running. **Ideal for off-road racing and competition use.**

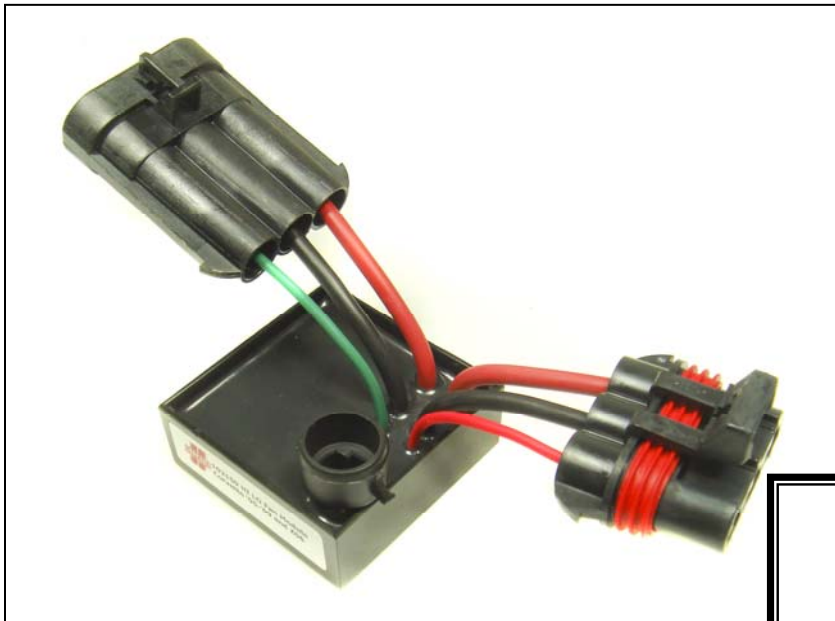

Control switch requires a 20mm mounting hole. Three switch positions:

- Low – Half speed fan control
- Normal (ECU Control)
- High – Maximum coolant fan speed

This gives the driver complete control of engine cooling. Switch can override fan control unattended, even with no key in the ignition.

Control Module is designed to plug in-between the sealed fan connector and its mate.

Module is completely sealed from moisture and contaminants, and incorporates three sealed connectors. Switch harness plugs into the small round connector.

Very simple Installation!
Installs typically in less than one hour.

Harness can be run thru the driver side door jamb, under the weatherstrip and into the passenger compartment without the need to drill thru the firewall.
